Our company can supply many kinds of forged car wheels in China. Also, our factory is only one factory, which can produce three-piece forged alloy wheels in China, also won the Shanghai World Expo 2010 Gold Award. The product quality meets the standards set out by DOT, TUV and VIA, and has obtained TS/16949 certification.

Based on our creative spirit, proprietary brand and design, our factory has successively obtained eight technical patents (including two invention patents and six utility patents) and reserves complete title and full intellectual property rights for this product in addition to applying for several other patents.

Our three-piece forged alloy wheels are made of series-6 aluminum used in the aviation industry and thereby present high performance and high tech auto wheels. They play a leading role in the international motor vehicle wheel industry. The wheel is a vast improvement over the common cast wheels in terms of strength, quality, appearance and molding. Other properties include light weight, high strength, less fuel consumption and better reliability.

The wheels are made up of a three-piece composite (Centre, inner & Outer) and are highly customizable. We can design and make wheels based on customers' individual needs to provide exact fitting to vehicles, as well as make separate wheel components, if needed. Three-piece wheels give the vehicle a unique look, thus making them highly desirable. Our wheels are currently available in size 18", 19", 20" and 22".

At present, many types of wheels are available for selection by our clients. Our products have a competitive edge over foreign products in terms of price, quality, service, maintenance and delivery time.

Our goal is to produce high end and competitively priced products supported by excellent customer service.
